

Shaping the future of medicine together

Our Mission

“iRegMed establishes innovative treatment in health centres and catalyses the systematic data growth of an electronic patient record.”

Time for a real change

iRegMed revolutionises the health market

iRegMed is an open & systematically growing ecosystem, which combines medical treatment and research with the insurance of personal and scientific data.

We want to introduce a new structure of the health market in order to construct effective treatment methods and a fair system for the patients.

Furthermore, we want to replace the framework that is detrimental to innovation and offer an alternative to the insurance and counselling system.

The necessity results from the status and is subject to the future challenges in the health market.

The situation

- increasing restriction of the services (the system is detrimental to innovation)
- increasing health insurance contributions with low efficiency
- high basic costs combined with an unfair fee
- insufficient incentives for preventive and health-promoting measures
- patient data scattered or available centrally
- demographic change

Requirement for a change is obvious. We introduce this through a patented medical procedure, which is already applied – combined with the possibilities of block chain technology.

Our goals

iRegMed

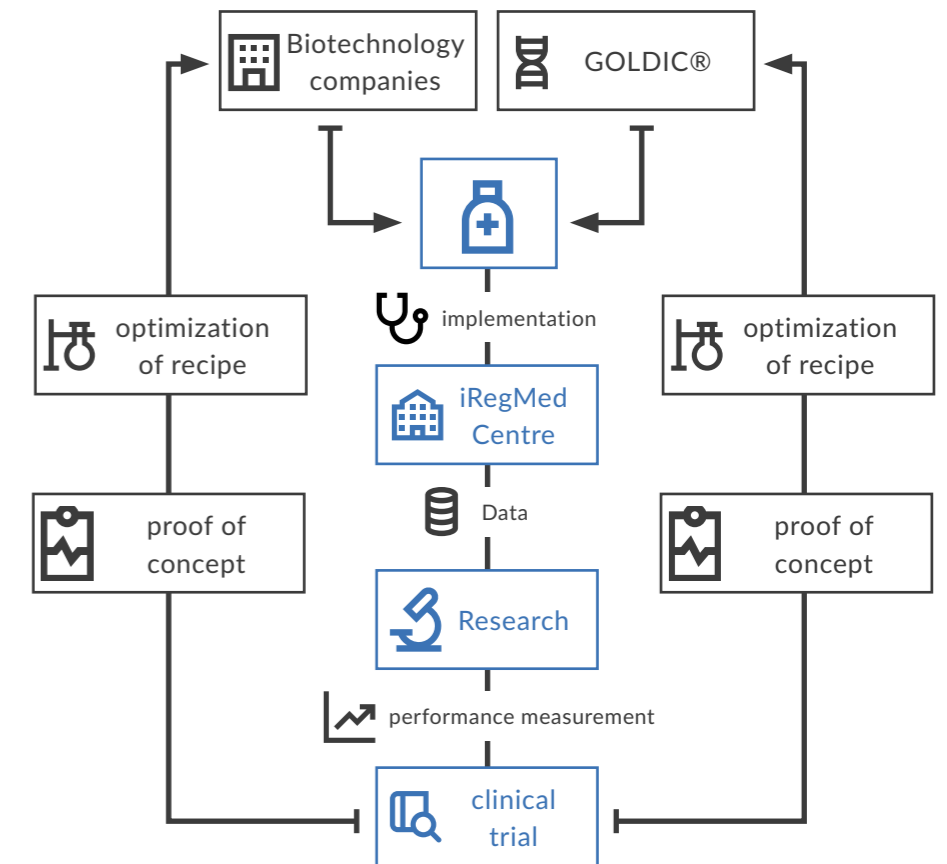

New Paths in Medicine

Medicine

The medical part of iRegMed has the task of treating patients with innovative, regenerative treatment – the focus lies on the causes and less on the symptoms. One of the hitherto developed treatments is the patented GOLDIC® procedure.

iRegMed goals

- Establishing affordable, treatment that is virtually free of side effects, that heal and do not combat symptoms
- Development of new innovative procedures to market maturity
- Creation of an efficient, transparent documentation and study system available online
- Sensitization for the use of electronic patient records

Our goals

iRegMed

Big Data – safe and anonymous thanks to blockchain

Technology

The technological part of iRegMed allows the decentralised, safe administration and transmission of medical data.

This technique serves as the research and development:

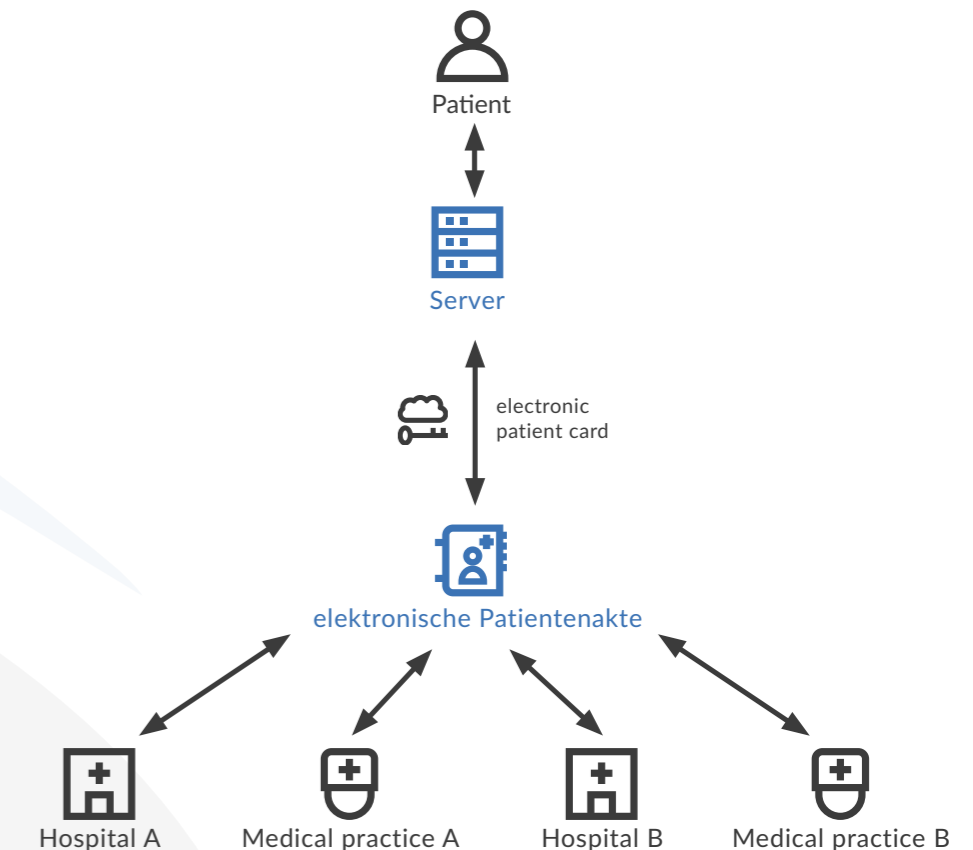

- To maintain the maximum transparency in the collaboration with universities and researchers (documentation/clinical studies)
- To evaluate and optimise existing procedures
- To successfully establish electronic patient records

The electronic patient record iRegMed:

- Is safely and anonymously encrypted via the block chain (**without Man in the Middle**)
- Allows the patient entire control of his data

- Can be with the collected data basis for a fair and goal-oriented insurance
- Supports doctors and patients with its constantly systematic growth and a selflearning Artificial Intelligence (AI)

Big Data Solution replaces the structures available.

The Concept

iRegMed medical **Three for Innovation**

iRegMed sets out to establish regenerative treatment and, hence, create an autonomous system, which

- treats patients with biological and regenerative treatment at iRegMed centres
- develops new treatment with iRegMed research and conducts studies
- trains and educates doctors and medical personnel via the iRegMed Academy.

With the treatment centred on the cause and not on the symptoms, iRegMed strives for an effective value increase for the patients with innovative treatments.

GOLDIC[®] procedure

With the patented GOLDIC[®] procedure, it concerns a strongly anti-inflammatory treatment, which regulates pain and activates and promotes the differentiation of endogenous stem cells. It is applied at iRegMed centres.

Since 2010, more than 2,500 patients with different inflammatory and degenerative diseases have been treated with success in different areas: **rheumatology, orthopaedics, sports medicine, neurology, dermatology, dentistry and ophthalmology.**

The first iRegMed Centre on Lake Tegernsee

Treatment at the iRegMed centre

The first iRegMed Centre is inaugurated on the 1st of June, 2018, in the Gmund, at Lake Tegernsee.

PRIVATE EQUITY INVESTMENT: around 2.000.000 €

The Concept

iRegMed technologically

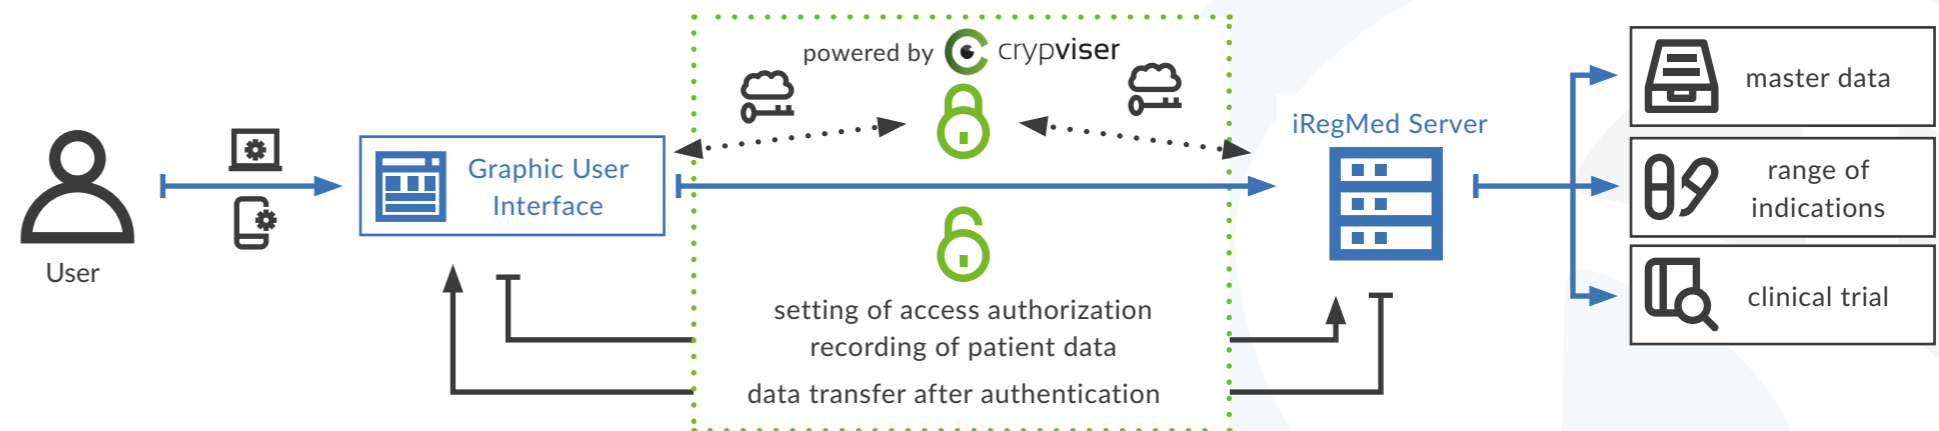

Data are optimally protected & optimally used

The authentication model of iRegMed enables the distribution and authorisation of public keys in the peer-to-peer mode or automated via the block chain and a secure, anonymous data transfer.

The Man-in-the-Middle move is the largest historical challenge of asymmetrical cryptography, which represents the foundation of an end-to-end encryption model. The block chain technology offersthe possibility for this.

Advantages of the electronic patient record

- **Complete data control by the patient**
- Increase of efficiency and treatment quality by collection of all patient data in one record
- Prevention of faulty and double treatment
- Transparency for the research in entire anonymity
- Maximum security by decentralised encryption without Man-in-the-Middle
- Creation of an efficient insurance structure
- Support for doctors and clinics and recommendations for patients (AI)

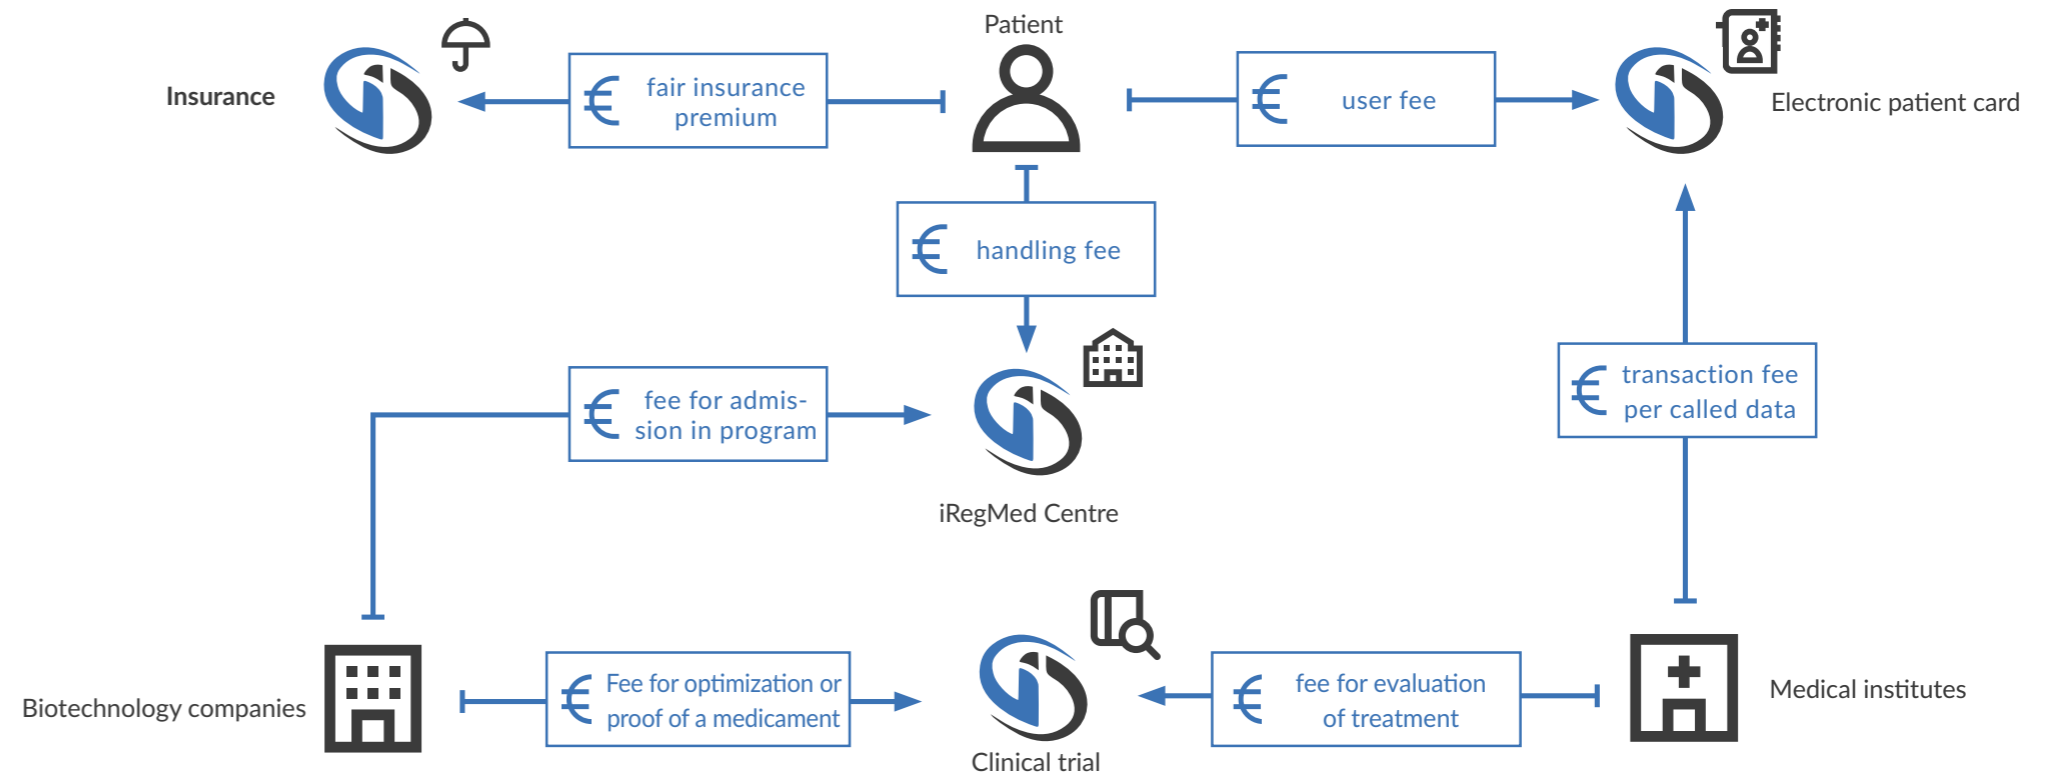

The System

Diverse monetisation

Efficient and transparent

iRegMed is the answer to the requirement and the necessity, existing or new procedure at universities, clinics and research institutes to be documented efficiently and transparently. The decentralised patient record secures for the patient the best potential treatment in maximum data security.

The arrows stand for potential cash flow – and hence for receipts. Generally, however, the patient should be exonerated in this system in the mediumterm and long-term, at the latest if a successful monetisation takes place through medical institutions and biotechnology companies.

Roadmap

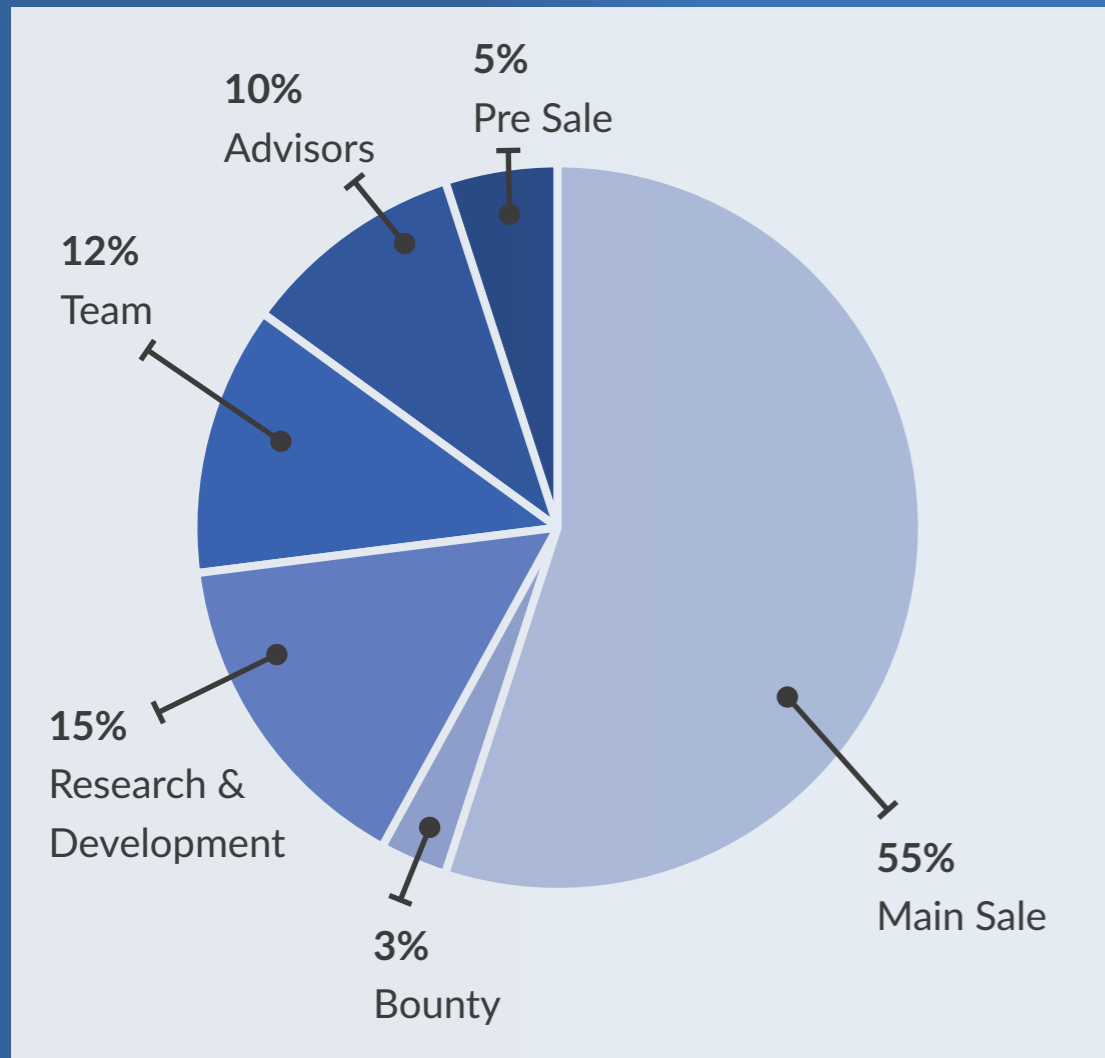

2017

2018

The iRegMed Token

Token Distribution

Token Sale

PRIVATE SALE Begin 04/24/2018

PRIVATE SALE BONUS 35%

Token Sale Q3 .2018

Tokens CREATED 200 Millionen

Tokens for SALE 100 Millionen

Circulating Supply 140 Millionen

Sale participation

Payable with Ethereum as well as bank transfer euro dollar to a Luxembourg account of iRegMed S.a.r.l. Unsold tokens are eliminated.

**We revolutionise the health market.
